# Moving Average Analysis of Plastic Production Yield in a Manufacturing Industry 

Ezeliora Chukwuemeka Daniel, Onyechi Pious Chukwukelue, Chinwuko Emmanuel Chuka and Chukwumuanya Emmanuel Okeychukwu<br>Department of Industrial and Production Engineering, Nnamdi Azikiwe University Awka, Anambra State, Nigeria cezeliora@gmail.com, pconyechi @yahoo.co.uk, chinwukoemmanuelc@yahoo.com, okeychukwuchukwumuanya @ gmail.com

#### Abstract

This research work was used to address the problem of Analysis of the forecasting of plastic yield in Finoplastika manufacturing industry. Data on production yield were collected from the industry covering a period of three years. Forecasting based time series technique was applied to determine the optimum production yield in the industry and the behavior of the production system. Hence the model is fit for predicting the product total, since the coefficient of determination shows a strong relationship. The model was therefore used to suggest optimum monthly production output for different product types investigated. This will prevent the incident of under producing or over producing as identified.

Keywords- Plastic, Production, Forecasting and Moving Average

## I. INTRODUCTION

Over the years, the company has made substantial progress. However there is no formalized way of determining what quantity of different products to be produced over any given period of time. This leads to inconsistencies in planning and production. To avoid any of these problems during production, there is a need to optimize in advance the quantity of products, in other to support decision making regarding quantity of the plastic products necessary for production in every month.
The objective of this report is to develop a time series technique and regression analysis in order:
$\checkmark$ A "moving average" was developed from the data in order to predict the optimum production of product types investigated.
$\checkmark$ To help us study the various components, that plays a major role in the decision making and market strategy.
$\checkmark$ To optimize the Production planning system in the manufacturing industry.
$\checkmark$ To make recommendation to the company based on the research findings.
Time-Series Forecasting: Univariate time series forecasting models make predictions by extrapolating the past behavior of the values of a particular single variable of interest (Moore \& Weatherford, 2001). Successive observations in econometric time series are normally not independent and predictions may be made from previous observations (Chatfield, 1996). While exact forecasts are possible with deterministic time series, forecasts of stochastic time series are limited to "conditional statements about the
future based on specific assumptions" (Chatfield, 1996). According to Armstrong (2001), "the basic assumption is that the variable will continue in the future as it has behaved in the past." Specifically, time series forecasts are appropriate for stochastic data where the underlying causes of variation trend, cyclical behavior, seasonality, and irregular fluctuations - do not change significantly in time (Jenson, 2004). Hence, modeling is often more appropriate for short-term than for long-term forecasting.

Moving Average: one weakness of the naive method is that the forecast just traces the actual data, with a lag of one period; it does not smooth at all. But by expanding the amount of the historical data a forecast is based on, this difficulty can be overcome. A moving average forecast uses a number of the most recent actual data values in generating a forecast (Yaffee, 2000). The moving average forecast can be computed using the following equation:

$$
F_{t}=M A_{n}=\frac{\sum_{i=1}^{n} A_{t-i}}{n}
$$

Where, $i=$ An index that corresponds to time periods
$n=$ Number of periods (data points) in the moving average
$A_{i}=$ Actual value in period $t-i$
$M A=$ Moving average
$F_{t}=$ Forecast for time period t
Weighted Moving Average: A weighted average is similar to a moving average, except that it assigns more weight to the most recent values in a time series.

In general,
$F_{t}=W_{n} A_{t-n}+W_{n-1} A_{t-(n-1)}+w_{1} A_{t-1}$

For instance, the most recent value might be assigned a weight of .40 , the next most recent value a weight of .30 , the next after that a weight of .20 , and the next after that a weight of .10 . Note that the weights sum of 1.00 and that the heaviest weights are assigned to the most recent values (Delurgio, 1986).

Exponential Smoothing: is a sophisticated weighted averaging method that is still relatively easy to use and
understand. Each new forecast is based on the previous forecast plus a percentage of the difference between that forecast and the actual value of the series at that point. This is: Next forecast $=$ Previous forecast $+\alpha$ (Actual - Previous forecast)
Where (Actual - Previous forecast) represents the forecast error and $\alpha$ is a percentage of the error. More concisely,

$$
F_{t}=F_{t-1}+\alpha\left(A_{t-1}-F_{t-1}\right)
$$

where $F_{t}=$ Forecast for period t
$F_{t-1}=$ Forecast for the previous period
$\alpha=$ Smoothing constant (represents the percentage of the forecast error)
$A_{t-1}=$ Actual demand or sales for the previous period (Stevenson, 2005)

## II. RESEARCH METHOD USED

The research method used in this work is a quantitative research approach. The data gathered were the daily record of plastic pipes production over the month for three years. The research method emphasis detailed analysis of the time series technique was also use to understand in details the analysis of the moving average that shows the optimization of the production yield of the data on monthly basis for a period of three years. The use of Minitab tool was applied for the development of various analyses and the achievement of the results.

Company Data Presentation: the company production quantity of the data is shown in Table 1.

## III. METHOD OF DATA ANALYSIS

In the method of data analysis, some group of data were analyzed by using moving average to optimize the production yield, seasonal influence and regression analysis to show the change in the independent that was explained in the dependent in the manufacturing industry. The use of minitab tool was made to test for the various analyses.

## A. Estimation of Trend using a 12 month Centered Moving Average

Table 1 will be used to find the 'linear' trend line-storage for the monthly number of total products of the finished products. Since, the data exhibit a natural 12- monthly cycle, the method of moving average is used. Below is the summary of the moving average analysis using the Minitab.

Figure 3: Moving Average for (PT) Data

Figure 3 is to show the moving average of the PT (i.e. production yield in units) product over a period of three years. It shows the average movement of the data over the period of time. When the moving average line is low, it means that there is small product of PT. But when it is high, it means that there is large quantity of the PT product.

Figure 4 is to show the moving average of the P1 (i.e. production yield in units) product over a period of three years. It shows the average movement of the data over the period of time. When the moving average line is low, it means that there is small product of P 1 . But when it is high, it means that there is large quantity of the P 1 product.

Figure 5: Moving Average for (P2) Data
Figure 5 is to show the moving average of the P 2 (i.e. production yield in units) product over a period of three years. It shows the average movement of the data over the period of time. When the moving average line is low, it means that there is small product of P 2 . But when it is high, it means that there is large quantity of the P 2 product.

Figure 6: Moving Average for (P3) Data
Figure 6 is to show the moving average of the P3 (i.e. production yield in units) product over a period of three years. It shows the average movement of the data over the period of time. When the moving average line is low, it means that there is small product of P3. But when it is high, it means that there is large quantity of the P3 product.

Figure 7 is to show the moving average of the P 4 (i.e. production yield in units) product over a period of three years. It shows the average movement of the data over the period of time. When the moving average line is low, it means that there is small product of P 4 . But when it is high, it means that there is large quantity of the P 4 product.

Figure 8: Moving Average for (P5) Data
Figure 8 is to show the moving average of the P5 (i.e., production yield in units) product over a period of three years. It shows the average movement of the data over the period of time. When the moving average line is low, it means that there is small product of P5. But when it is high, it means that there is large quantity of the P5 product.

Figure 9: Moving Average for (P6) Data
Figure 9 is to show the moving average of the P6 (i.e. production yield in units) product over a period of three years. It shows the average movement of the data over the period of time. When the moving average line is low, it means that there is small product of P6. But when it is high, it means that there is large quantity of the P6 product.

Figure 10: Moving Average for (P7) Data
Figure 10 is to show the moving average of the P7 (i.e. production yield in units) product over a period of three years. It shows the average movement of the data over the period of time. When the moving average line is low, it means that there is small product of P7. But when it is high, it means that there is large quantity of the P7 product.

Figure 11: Moving Average for (P8) Data

Figure 11 is to show the moving average of the P8 (i.e. production yield in units) product over a period of three years. It shows the average movement of the data over the period of time. When the moving average line is low, it means that there is small product of P8. But when it is high, it means that there is large quantity of the P 8 product.

## Discussion of Results

This is based on the results found from the analysis, and also the tables and charts developed:
$\checkmark$ Observe that the Table 1 shows the detailed summary of the 12 monthly centred moving averages and the trend analysis.
$\checkmark$ Observed that the data was optimized for production yield on the monthly bases.

## IV. CONCLUSION

In conclusion, a close examination of the production pattern and the behavior of the production system based on the data analyses shows that the production industry is organizing production with a clear focus to meet the customers' requirements and stiff competitors in the plastic manufacturing industry. However, greater percentages of the customers are not served as and when due leading to queues and waiting before customers are served. The tool developed can help the company to remedy this situation.
